

Barcode Reading

Q How do I correct the problem where data is outputted incorrectly? (only when the scanner is connected via USB port)

A When the scanner is able to read the barcode the problem may be caused by the incorrect host interpretation of the USB protocol. The USB Laser scanner is too fast for the host system. Please use the following barcodes to adjust the USB speeds.

- **USB0:** Regular speed mode. Usually for older operating systems like Windows 98 when default setting is not working.
- **USB1:** Full speed mode. The default speed of the scanner.
- **USB2:** Middle speed mode. Usually for Mac O.S. or Linux O.S when default setting is not working.
